SUNSEEKER SELECTS SEAKEEPER GYRO SYSTEMS

Seakeeper is pleased to announce that one of the industry's largest and most prestigious yacht builders, Sunseeker, is now offering Seakeeper Gyro Stabilization Systems on a number of models. The Seakeeper M7000 gyro will be engineered on the Manhattan 60 and 70, as well as the Predator 64 and 74. Sunseeker will also offer Seakeeper units on larger models as an option. Interested parties should contact Sunseeker directly for more detailed model and installation information.

"The Seakeeper M7000 series gyro has been evaluated in a Sunseeker 70 Manhattan Flybridge Yacht and has outperformed all other similar units tested," said Dave Thomas, marine engineer at the Sunseeker Design Office in Poole, UK. "It is a well engineered product that gives good roll reduction performance for its weight and size envelope."

"We are thrilled Sunseeker has chosen to utilize Seakeeper gyro stabilizers as a means to offer their customers an option for enhanced luxury, comfort and enjoyment," said Andrew Semprevivo, Seakeeper's international sales manager. "Boat roll has always been the worst part of spending extended time on board. With the yacht stabilized, they can enjoy their passion more often and in a variety of sea conditions and locations."

After a rigorous evaluation, Sunseeker chose Seakeeper's advanced gyro as its ideal stabilization solution. The company has an extensive line of over 21 models with yachts ranging from 10.7m to 36.6m in length. Seakeeper has also performed numerous successful retrofits, including on Sunseeker 82s in France and California.

A leader in internal gyro stabilization technology, Seakeeper systems produce an incredible amount of righting force, virtually eliminating boat rock and roll. Controlled by motion sensors and computer processors, they're highly effective over a range of conditions. Operating in a near-vacuum, the compact gyros weigh less and consume less power than comparative products.
